Motivation

Single-cell transcriptomics has a great potential to characterize disease-related cell subpopulations. However, it remains a challenge to compare cell subpopulation across multiple individuals and different conditions. We created the interactive explorer of single cell cluster similarity (ieCS), an R package with an interactive graphical user interface that aids to explore similarity of cell clusters among heterogeneous datasets.

Features

- Shiny Application
- Quantify similarity of cell clusters
- Identify superclusters across datasets
- Visualize dynamic supercluster composition interactively
- Annotate cell clusters with custom reference

Workflow

ieCS requires cluster specific marker genes in individual datasets as input and quantifies similarity in pairwise clusters based on the ranks of overlapping marker genes. Based on the obtained similarity scores, ieCS then provides three methods to identify superclusters of similar cell clusters within a sample and also across different samples: hierarchical clustering of cell clusters, the Louvain community detection on a similarity network of cell clusters, and a greedy method to aggregate cell clusters into a tree structure. ieCS allows users to interactively explore superclusters and to visualize dynamic supercluster composition. In addition, ieCS accepts custom markers of cell type to annotate cell clusters.

Demonstration dataset

A ClusterSimilarity UploadData CSHierClust CSTree CSGraph CellEmbeddingPlot

Choose Individual Cluster Markers CSV File

Browse... ifnb.Indi.Markers.csv Upload complete

Choose Reference Cell Type Markers CSV File (Optional)

Browse... ifnb.Ref.Markers.csv Upload complete

Configure-Individual Cluster Markers File

Markers Order by: avg_logFC

Markers: gene

Individual Cluster Information: cluster

Individual Cluster Information: IndiCluster

Hover Annotation: seurat_annotations

Show result from: Individual Clusters With Reference

MetaGroupPlot CSHierClustSupercluster CSTreeSupercluster CSGraphSupercluster

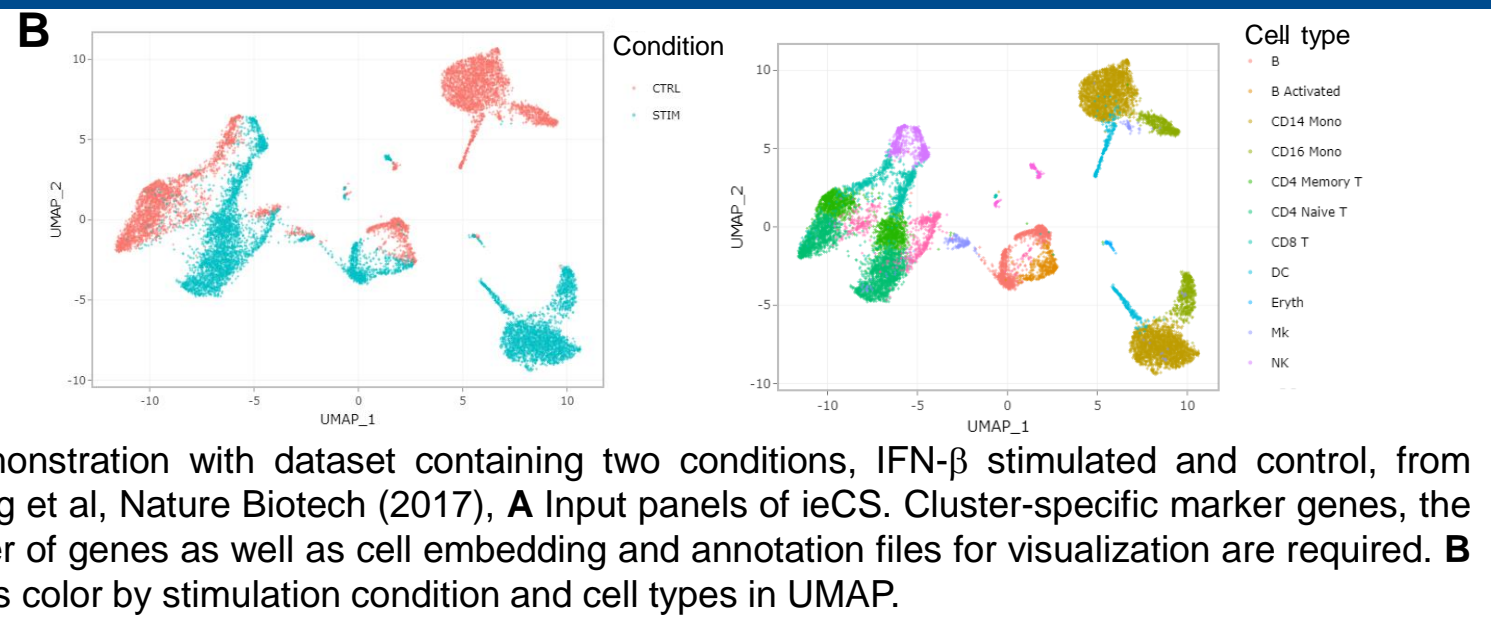

Color by: stim

Configure-Reference Cell Type Markers File

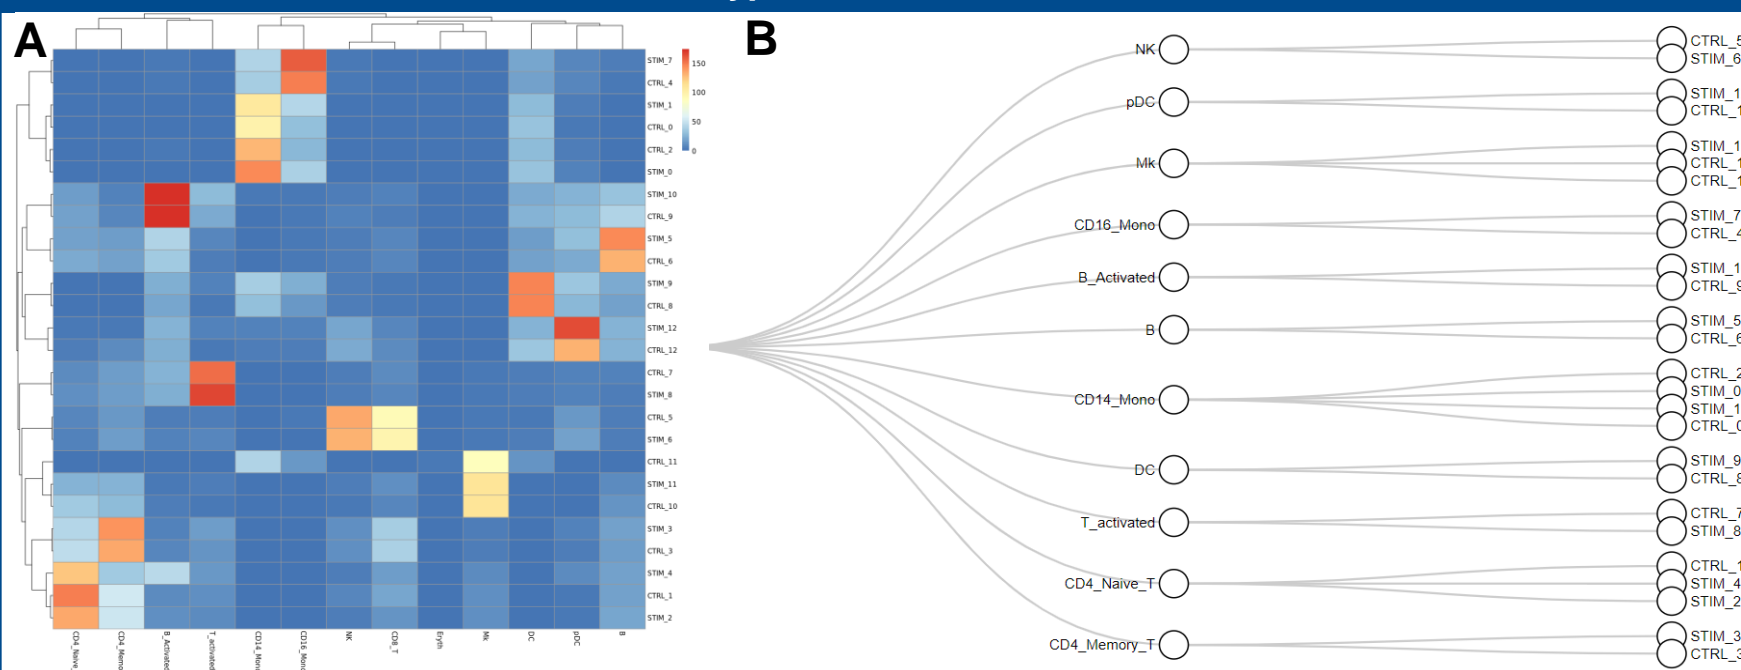

Markers Order by: avg_logFC

Markers: gene

Cell Type Information: cluster

Cluster annotation with markers of cell types

ieCS accepts custom markers of cell types to annotate cell clusters. **A** Heatmap of cluster similarity between cell types and IFN- β dataset. **B** Assignment of IFN- β clusters to cell types based on similarity scores.

Supercluster identification
